

Smart energy future ... whatever that means?

**Smart systems: The view of a distribution system operator, Enedis**

# Enedis, the essential grid of the French electricity system

# Enedis public utility missions

## Electricity distribution in France

- The public electricity distribution grid belongs to the local communities
- They entrust their maintenance and development to Enedis
- Enedis is the main manager of the French distribution grid, covering 95% of the country

# Enedis in a nutshell

**€ 13, 845 bn** revenue in 2016

**€ 3, 461 bn** investments in 2016  
(7% average annual growth since 2008)

**36 million** customers

Interventions 24 hours a day

**38 507** employees

**359 053** generation facilities  
connected to the distribution grid in  
France

# An expanding network

**1 348 876 km  
of power line  
(MV and LV)**

**98.4%** new MV lines underground

**8 288 km** of open wire MV and LV  
overhead lines dismantled

**16 728 km** of new MV and LV twisted  
underground lines laid

**2 260** power substations

# Radical changes expected for power distribution networks

Climate and decarbonisation policies, and technical and digital innovation are driving radical changes to the business of distribution system operators (DSOs)

They are responsible for connecting and integrating large-number of small scale decentralised renewable energy sources as well as battery storage, charging stations for electric vehicles.

They will have to face demand side management, selfconsumption (prosumers) and improved energy efficiency.

Access to more data will have to be managed for end-users as well as for different stakeholders of the electric system value chain.

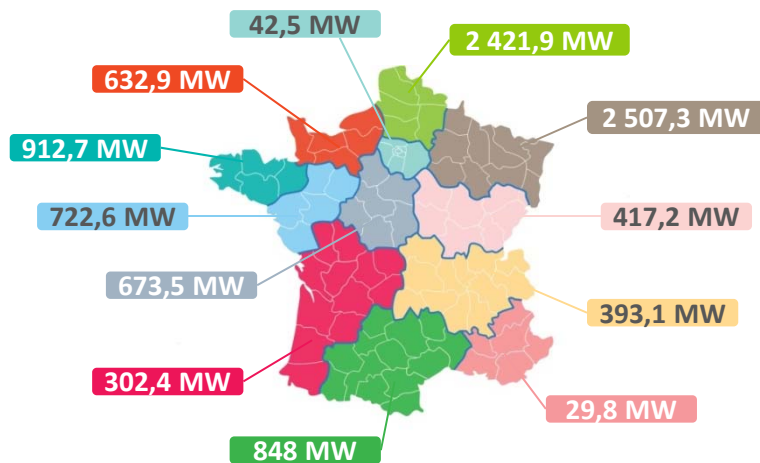

# New challenges for DSOs

- High volumes of new data from numerous and diverse sources, and increasing complexity in system architectures and processes, which introduce business risks and the potential for increased costs;
- Regulatory frameworks that are not designed for the new world - resulting in the real risk of loss of profitability and a resulting stifling of innovation; essential for driving the changes needed ;
- The mismatch between regulatory incentive mechanisms for DSO investment and optimal levels of capital and operational expenditure;
- Network planning and construction based on false conditions and incorrect business assumptions.

# Support new renewable energy developments

Installed windfarm

1 353 connected installations

9 904 MW\*

Installed photovoltaic inventory

350 986 connected installations

5 652,9 MW

\*Connected generation facilities power

# Increasing commitments towards our customers

Core service commitments

**SAIDI (System Average Interruption Duration Index)**

(excluding one-off events and transmission grid incidents)

Despite a number of significant weather hazards, SAIDI was maintained at a low level for the third consecutive year in 2016. This performance reflects our investments efforts over the last few years that are continuing in 2017.

# A cost efficient company

Despite a number of customers per km of electric line smaller than in other European countries, Enedis provides good quality services with one of the most competitive prices in Europe.

Benchmarking of electricity transmission costs with TURPE 4 (share of Enedis)	Household 3 kVA simple rate	Household 9 kVA and electric heating	Small SME 50 MWh with a power of 50 kW	Large PME 400 MWh with a power of 130 kW	Industry 24 GWh with a power of 6 MW
Deviation from the European average	-31%	-9%	-17%	-30%	-39%

From : European benchmarking of the charge for use of electricity distribution networks – Schwartz & Co for the Energy Regulation Commission

# Keep DSO as local operator: remain regional project partner

Major town planning and housing renovation projects

Contribution in town planning design

Support of local town planning (LRP) and territorial climate-air-energy plans (PCEAT)

Conventions for access to services in rural areas

Support of positive energy territory for green growth (TPECV)

Consulting and studies for the creation of development areas

Bad-weather correspondants

CITES approach (initiatives, territories and company contact)

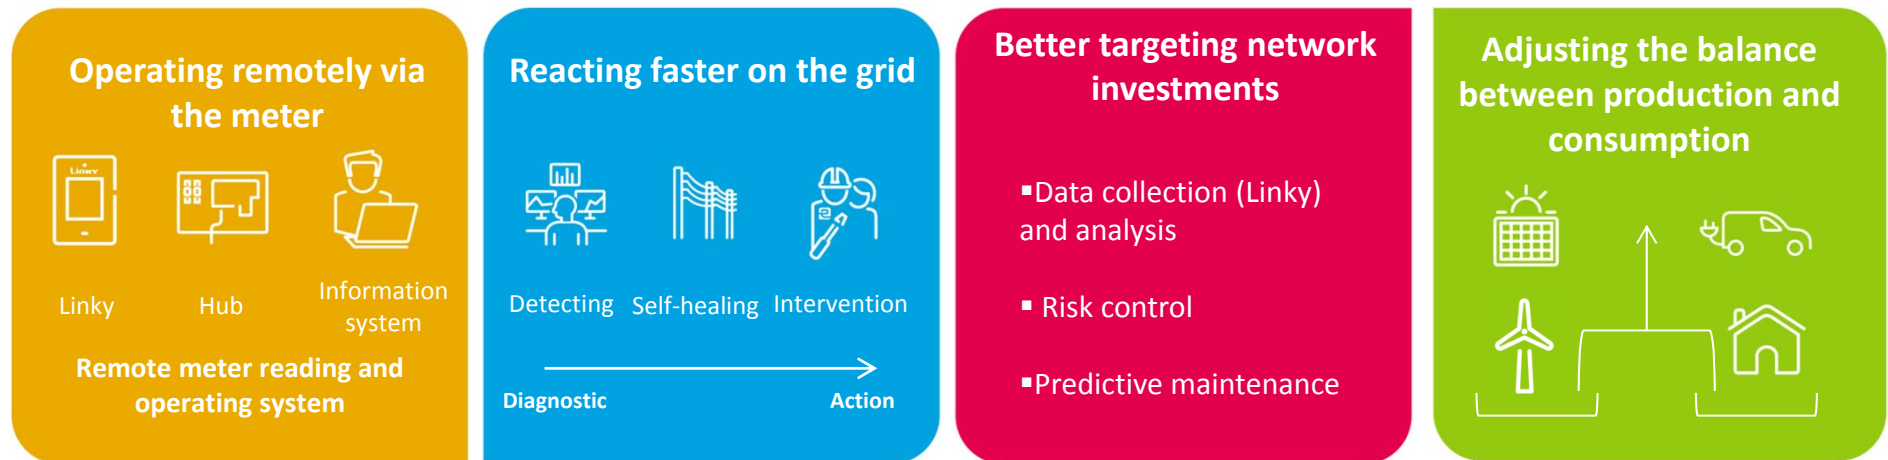

# Deploy secure and high standards technologies: smartgrids consistent with new uses

**Linky, a new communicating meter**

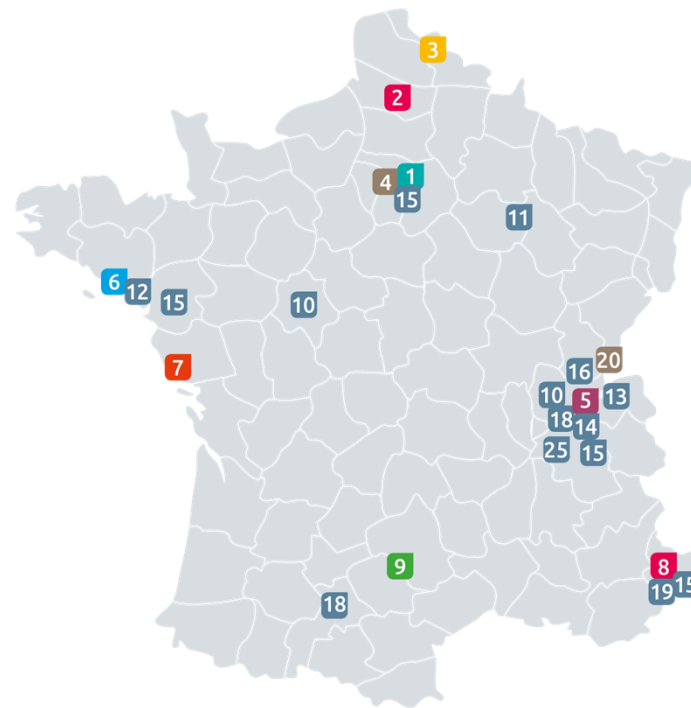

-  **35 million** Linky meters
-  **a 6 years** deployment
-  **€5 billion** total budget

# Smartgrids consistent with new uses

# Smart grids : the installation of demonstrators in France and Europe

- BienVEnu 1**  
Experiment new solutions to optimise electric vehicle recharging in residential housing
- Poste intelligent 2**  
Digital technology embedded in primary substation for better interface between high and medium voltage networks
- SoMel SoConnected 3**  
Business models experimentation for the deployment of smart grid solutions in urban area
- ISSYGRID 4**  
District-wide energy optimisation
- SMAP 5**  
Facilitating of rural renewables development
- SOLENN 6**  
Contribution of smart grids to manage the electricity demand and to develop alternative to load shedding
- Smart Grid Vendée 7**  
Optimise consumption and production over a region
- Interflex – démo France 8**  
Experiment new network solutions in order to improve the reliability and efficiency of a local electric system
- Smart Occitania 9**  
Experiment new solutions to support energy transition in rural areas

Projects completed

- 20 Smarter Together**
- 21 Flexiciency**
- 22 Interflex**
- 23 Advanced**
- 24 Grid4EU**
- 25 Transform**
- 26 Green Grid**
- 27 evolVDSO**
- 10 Linky**  
An experiment on nearly 300,000 smart meters
- 11 Ventea**  
Integration of important capacities of wind energy in a rural network
- 12 Houat et Hoëdic**  
Secure the power supply of two islands through power modulation and redistribution of energy
- 13 Watt & Moi**  
Secure one-line access to electric consumption information
- 14 GreenLys**  
Smart grid contribution to urban areas equipped with LINKY
- 15 InfiniDrive**  
Management of recharging infrastructure for electric vehicles
- 16 Lyon Smart Community**  
Management of smart buildings, electric vehicles and solar energy
- 17 SOGRID**  
Development of a new PLC communication chain (Power Line Communication) to enhance the control of the distribution network
- 18 Smart Electric Lyon**  
Experimentation of innovative offers and services for customers downstream the meter
- 19 Nice Grid**  
Contribution of a smart-solar district: handle demand peaks and better take advantage of solar production

# The digital and environmental transitions

- Digitisation and open management of data: new prospects for electricity distributors
- Energy transition and the digital revolution are key drivers of distribution grids transformation
- Enedis power distribution grids are already smart and become even smarter:
  - equipped with sensors capable of providing information and data – the leading example being the 35 million smart electricity meters to be installed in French households by 2021.
  - Backed by recent legislation, the trend toward open data is, for DSOs, both a requirement and a lever: an economic, social and environmental requirement for enabling localities to prove their sense of responsibility and for developing innovative services for citizens;
  - but also a lever for distributors to become operators who, processing dynamic data, are open to their ecosystem – a lever for making new business models emerge for the local management of energy.

# Databases, key element of the energy transition

In order to effectively support the energy transition, Enedis makes its data available to the actors of the electricity system.

**18 datasets available to the actors of the electricity system on the OpenData platform\***

Weekly electric report

Annual electricity production report up to the municipalities scale (IRIS)

**Contribution to the French Government data platform « Etalab »**

\*<https://data.enedis.fr>

# Changing business model

- Radical changes (social, technologies, regulation) unavoidable.
- How can DSOs anticipate and make the most of its new role in the decentralised world, while mitigating other changes (EVs, DSM, storage)?
- Answer: develop modelling and planning of decentralised energy scenarios, which will enable DSOs to think systematically about future developments and derive the best possible decisions on a quantitative basis.
- Most observers considers the focus will increasingly be on DSOs to make sure their systems are balanced and not overloaded:

**This is the century of DSOs** (Klaus-dieter Borchardt, EU, DG Energy)

# The Winter « Clean Energy » Package

*On 30th November 2016, the European Commission published the Winter « Clean Energy » Package on Energy Union, which:*

- Acknowledges the role of DSOs as important actors at the heart of the energy transition
- Associates DSOs as key players in the European governance, through the introduction of a European Entity for DSOs
- Affirms the importance of distribution networks reinforcement
- Instructs DSOs to own, develop, manage or operate recharging points for electric vehicles
- Approves DSOs as neutral data managers

# Opportunities for DSO's

- Encourage cross-border cooperation between distribution system operators .
- Interconnect the pioneers of local energy governance. Create a European Forum of the territories.
- Pool the European efforts of R&D with respect to smart grids.
- Create a European energy data platform.
- Map out European corridors for innovative mobility.
- Establish a Europe Energy College

Thank you for your attention
